

1) Created a data container and added csv file to be queried:

The screenshot shows the Synapse Studio interface. On the left, the 'Data' pane is open, showing a 'Workspace' and a 'Linked' section. Under 'Linked', there is a filter 'Filter resources by name' and a list of resources. The 'data (Primary)' container is selected. On the right, the 'data' container is expanded, showing a table with columns: Name, Last Modified, Content Type, and Size. The table contains one row: 'data.csv' with a last modified date of '4/28/2026, 3:16:31 PM' and a size of '811 B'.

Name	Last Modified	Content Type	Size
data.csv	4/28/2026, 3:16:31 PM		811 B

2) Created dynamic SQL-based query in Built In pool to query the csv file:

The screenshot shows the Synapse Studio SQL script editor. The 'Connect to' dropdown is set to 'Built-in' and the 'Use database' dropdown is set to 'master'. The SQL script is as follows:

```
1 DECLARE @path NVARCHAR(1000) =  
2 'https://synpasedatalake2026.dfs.core.windows.net/data/data.csv';  
3  
4 DECLARE @sql NVARCHAR(MAX);  
5  
6 SET @sql = '  
7 SELECT *  
8 FROM OPENROWSET(  
9     BULK '' + @path + '',  
10    FORMAT = ''CSV'',  
11    PARSE_VERSION = ''2.0'',  
12    HEADER_ROW = TRUE  
13 ) AS [result];'  
14  
15 EXEC(@sql);
```
