

1) Created the data flow for the transformations:

2) Complete Data Flow:

Source (CSV Dataset)

Derived Column (Clean Salary)

- Replace NULL/empty Salary → 0
- Convert Salary to integer

Aggregate (Remove Duplicates)

- Group by: EmployeeID, Name, Department
- Keep: max(Salary)

Derived Column (Standardize Department)

- Trim spaces
- Replace space with "_"
- Convert to UPPERCASE

Derived Column (SalaryCategory)

- <3000 → LowCount
- 3000–7000 → MediumCount
- >7000 → HighCount

↓

Filter

- Keep only Salary > 0

↓

Aggregate (Department Level Metrics)

- Group by: Department
- sum(Salary) → TotalSalary
- avg(Salary) → AvgSalary
- count LowCount
- count MediumCount
- count HighCount

↓

Select (Final Output Columns)

- Department
- TotalSalary
- AvgSalary
- LowCount
- MediumCount
- HighCount

↓

Sink (Azure Sql Db)
